Background

Systematic review of 85 articles* shows:

- **No common protocols & standards** to describe, compare and report the evidence of the ecosystem services of GI
> *Need for a typology*
- **Spatial heterogeneity** precludes a clear identification of typologies
- **GI includes a combination** of natural, semi-natural and engineered elements.
- Current **classifications (i.e. LULC)** still inadequate > highly dependent on land-uses
- **Aspects** to consider to classify GI:
 - (1) Multi-functionality (trees vs parks)
 - (2) Spatial heterogeneity (what is GI?)
(*green-to-grey continuum*)
 - (3) Interconnectivity (boundaries)

* Bartesaghi Koc, C. et al (*in press*).

Proposed GIT matrix

CRC

After Bartesaghi Koc, C. et al. (2016a, *in press*)

GREEN INFRASTRUCTURE TYPOLOGY (GIT)			Ground surfaces (GS)							Building structures (BS)									
			Terrestrial surfaces (TS)					Water bodies (WB)		Roof structures (RS)						Vertical Structures (VS)			
			Impervious surfaces		Pervious surfaces			Vegetated	Non-vegetated	Intensive		Semi-intensive		Extensive		Living walls (rooted on wall)		Green facades (rooted on ground)	
			Artificial (Hard surfaces & pavements)	Natural (Bare rock)	Porous pavements	Bare soils, sands & perennial snow	Vegetated surfaces	Wetland (marsh, swamps, mangroves)	Open water (lakes, rivers, oceans)	Intensive semi-vegetated	Intensive vegetated	Semi-intensive semi-vegetated	Semi-intensive vegetated	Extensive semi-vegetated	Extensive vegetated	Modular panel & geo-textiles	Elevated substrate (box, pot, bag)	Traditional direct system	Double-skin indirect system
V.9			S1	S2	S3	S4	S5	S6	S7	R1	R2	R3	R4	R5	R6	V1	V2	V3	V4
No Vegetation																			
Vegetation layers (VL)	Ground vegetation (GV)	(L) Low vegetation Turf/lawn, grasslands/ prairies & herbaceous ground cover (< 0.5m)																	
		(M) Medium vegetation Shrubs, hedges & small trees (0.5- 2 m)																	
		(H) High vegetation Tall trees (> 2 m)																	
Climbing vegetation (CV)	Short climbers	Climber species (< 5 m)																	
	Tall climbers	Climber species (> 5 m)																	
TREE CANOPY (TC)			GREEN OPEN SPACES (GOS)							GREEN ROOFS (GR)						VERTICAL GREENERY SYSTEMS (VGS)			
Example of possible permutations				Pavement with shrubs and tall trees in rows		Vegetated surface of grass with scattered small trees		Swamp with dense clustered tall trees		Intensive green roof with small herbs, aligned shrubs and sparse trees		Semi-intensive green roof with medium density shrubbery	Spatial arrangements Aligned / linear / in rows Scattered / sparse Dense / clustered						

Refined GIT

GIT – Classification values

Based on Irger (2014) and Stewart & Oke. (2012)

CODE	TYPE	Impervious fraction	High Veg fraction	Med veg fraction	Low Veg fraction	Water fraction
Type 1	Highly impervious	≥ 80	≤ 20	≤ 20	≤ 20	≤ 20
Type 2	Mostly impervious with low plants	$\geq 40 - < 80$	≤ 10	≤ 10	< 50	≤ 10
Type 3	Mostly impervious with shrubs	$\geq 40 - < 80$	≤ 10	≥ 10	< 50	≤ 10
Type 4	Mostly impervious with trees	$\geq 40 - < 80$	$> 10 - \leq 40$	≤ 25	< 40	≤ 10
Type 5	Low Plants	≤ 20	≤ 20	≤ 20	≥ 80	≤ 20
Type 6	Mostly low plants with impervious	< 50	≤ 10	≤ 10	$\geq 50 - < 80$	≤ 10
Type 7	Mostly low plants with trees	< 50	$> 10 - \leq 50$	≤ 25	$\geq 40 - < 80$	≤ 10
Type 8	Shrubs	< 40	≤ 20	≥ 50	< 50	≤ 20
Type 9	Trees	≤ 10	≥ 50	≤ 10	< 50	≤ 10
Type 10	Mostly Trees with impervious	≥ 20	$40 - 80$	≤ 10	< 50	≤ 10
Type 11	Water	≤ 20	≤ 20	≤ 20	≤ 20	≥ 75
Type 12	Mostly water with low plants and shrubs	< 50	≤ 10	< 50	< 60	$\geq 50 - < 75$
Type 13	Sparse water with low plants and shrubs	< 50	≤ 10	< 50	≥ 10	$\geq 10 - < 50$
Type 14	Sparse water with trees	< 50	≥ 10	< 50	≥ 10	$\geq 10 - < 50$
Type 15	Mixed landscape

Findings – *Typology applicability*

Highly impervious		
# Grids: 837	Properties	Mean values
 <p>Type 1</p>	1. NDVI	- 0.015
	2. Impervious fraction	89.83 %
	3. Low vegetation fraction	7.32 %
	4. Medium vegetation fraction	1.05 %
	5. High vegetation fraction	1.80 %
	6. Water fraction	0.16 %

Mostly impervious with low plants		
# Grids: 1793	Properties	Mean values
 <p>Type 2</p>	1. NDVI	0.077
	2. Impervious fraction	67.94 %
	3. Low vegetation fraction	25.30 %
	4. Medium vegetation fraction	2.29 %
	5. High vegetation fraction	4.72 %
	6. Water fraction	0.09 %

Water		
# Grids: 2	Properties	Mean values
 <p>Type 11</p>	1. NDVI	-0.261
	2. Impervious fraction	14.65 %
	3. Low vegetation fraction	9.00 %
	4. Medium vegetation fraction	0.02 %
	5. High vegetation fraction	0.37 %
	6. Water fraction	75.98 %

- Very few number of unclassified grids ($n=54$ ~1.5%).
- Strong correlation between typologies' characteristics (surface fractions) and mean NDVI values.
- Impervious surfaces were the largest by far across the whole pilot study.
- The most numerous typologies combined impervious surfaces with low plants and few trees.
- Impervious surfaces combined building and ground surfaces; future work could consider their differentiation.

Mostly low plants with trees		
# Grids: 143	Properties	Mean values
 <p>Type 7</p>	1. NDVI	0.223
	2. Impervious fraction	27.36 %
	3. Low vegetation fraction	53.68 %
	4. Medium vegetation fraction	2.00 %
	5. High vegetation fraction	17.16 %
	6. Water fraction	0.24 %

Findings – *Typology applicability*

- Estimation of surface cover fractions results insufficient to classify tree canopy distribution → Need for differentiation between clustered and sparse arrangements in typologies 4, 7, 9, 10 & 14.
- LiDAR point cloud density and vegetation phenology have huge impacts on the accuracy and quality of vegetation / buildings extraction that potentially may lead to error (under-/overestimations).
- Red Edge NDVI thresholds should be further studied.
- The typology can be used for multiple purposes, though it is especially aimed for spatial and performance analyses (quantitative and qualitative), and for inventorying conditions to prioritise GI interventions.

Conclusions and future work

- A **standardised classification** scheme (conventions and protocols) to estimate the vegetation cover of large areas with high resolution and accuracy → Potential use to **inform and propose climate change** adaptation/mitigation strategies.
- The typology facilitates the **reporting** of the current state of environment, as well as **Inter-site & inter-typology comparison**.
- Other **indicators can be estimated and assigned to each typology** (i.e. biomass, carbon sequestrations, evapotranspiration, surface temperature, etc.)
- Next steps:
 - **To incorporate spatial metrics** to distinguish different arrangement of trees.
 - **To consider urban morphology aspects** by applying the GIT along with the local climate zones (LCZ) to assess the thermal profiles of GI.
 - **To test different grid sizes, NDVI thresholds and LiDAR extraction parameters.**
